THRIPS

Great havoc was caused the past season by a tiny insect called the gladiolus thrip. Altho found on other flowers it apparently does little harm to any but the gladiolus. As it is a new pest methods of control are not entirely perfected. Following preventative measures however have been tried with success by some of our large growers:

Gassing of bulbs is practiced some but rather inconvenient for average gardener, as most gasses are dangerous to use unless proper facilities are at hand. Napthalene flakes are highly recommended for the small grower, one ounce of the flakes to each 100 bulbs covering the bulbs as well as possible with heavy paper or boards for 2 or 3 weeks, this is claimed to kill any bugs which might be on the bulbs, also the eggs. It is best to apply flakes about 2 months after digging bulbs scattering the flakes among the bulbs. This can be done any time during the winter or a few weeks prior to planting. As an added precaution, before planting, soak the bulbs 3 hours in following: 1-2 oz. bichloride of mercury to 3 1-2 gallons of water, dissolve the mercury in pint of hot water and mix well. Lye can also be used 1 can to 20 gallons of water soaking about 7 hours.

Do not use metal container for mercury solution, as it corrodes metal.

If you see any on the plants spray them 2 or 3 times weekly, 2 tablespoons paris green, 2 lbs. brown sugar to 3 gallons of water makes a good spray; or it is claimed cold water spray will keep them down.

Some growers claim immersion in hot water from 112 to 120 degrees (not more than 120 degrees) for 10 minutes will kill bugs and eggs on bulbs. Care must be taken not to use the water hotter than 120 degrees as that would cause injury to the bulbs. All our bulbs have been fumigated against thrip.
